

# Exercises - Week 8

## Genomics and bioinformatics

This series is about Multiple Sequence Alignment (MSA).

### 1 MSA with ClustalW

ClustalW is a very popular web-based program for performing progressive multiple sequence alignment. His main homepage is located at <http://www.clustal.org>, but you can run ClustalW online on several servers on the web: in this exercise we shall use ClustalW2 located in the European Bioinformatics Institute (EBI) server at <http://www.ebi.ac.uk/Tools/msa/clustalw2>.

Figure 1: The five protein sequences (in FASTA format) and the PAM 250 substitution matrix.

1. Enter these five protein sequences in ClustalW2 with default parameters and click on "Submit".
2. In "Alignments" you will see the MSA found by ClustalW2.
3. In "Result Summary" the raw alignment scores between all pairwise alignments are shown. Press on "View Output" to see the total score associated to the MSA.
4. In "Guide Tree" you can see the tree used to generate the MSA by the progressive alignment method.
5. Try to change the parameters to see how this affects the MSA.
6. Consider now the PAM 250 scoring matrix (<http://www.bioinformatics.nl/tools/pam.html>) show in the figure: the value in each cell of a PAM matrix is related to the probability of a column amino acid before the mutation being aligned with a row amino acid afterwards. Adding a -10 gap penalty, compute the Sum-of-Pair (SP) score of the MSA, by hand or using Python or R [The MSA and PAM250 scoring matrix files can be found on Moodle].
